

		Total no of time <code>merge</code> is called = 5
	(e)	<p>The diagram illustrates the merge sort process. It shows a sequence of array splits and merges. The initial array [39.10, 17.50, 35.40, 42.68, 8.90, 35.40] is split into [39.10, 17.50, 35.40] and [42.68, 8.90, 35.40]. These are further split into pairs, then into single elements, and finally merged back into sorted sub-arrays. Red boxes highlight the recursive splitting and the final merge step. Dashed lines indicate the merging of sorted sub-arrays.</p>
	(f)	Regardless of the any possible cases <code>mergesort</code> will consistently divide the array by half recursively until the base case of 1 item remains, and then take linear time to recursively <code>merge</code> the two halves.
3	(a)	<p>A recursive algorithm is a method of programming where the algorithm to a function or procedure is:</p> <ul style="list-style-type: none"> • able to call itself one or more times in its body, and • terminates when it reaches its base case.
	(b)	<p>Mention of</p> <ul style="list-style-type: none"> • performing sequence of instructions repeatedly using loops • repetition continues unit condition fulfilled.
	(c)	FUNCTION SumOfCubes (n) RETURNS INTEGER

		<pre> IF n = 1 THEN RETURN n ENDIF RETURN n*n*n + SumOfCubes(n-1) ENDFUNCTION </pre>
	(d)	n getting too large may result in stack memory overflow which in turn result in a runtime error, eventually crashing the program.
4	(a)	<p>A linked list is a linear collection of data element whose:</p> <ul style="list-style-type: none"> orders are not given by their physical placement in the memory, makes use of pointers to connect one element to another, joining all the nodes to form a sequence
	(b)	a=7, b=10, c=2, d=4, e=0, f=9, g=5
	(ci)	<p>Head = 8 Free = 1</p> <pre> graph LR Head[8] --> Ali[Ali 5] Ali --> Ari[Ari 2] Ari --> Annie[Annie 7] Annie --> Cindy[Cindy 4] Cindy --> Lester[Lester 10] Lester --> Jenny[Jenny 9] Jenny --> Mimi[Mimi 0] Free[1] --> Node1[3] Node1 --> Node2[6] Node2 --> Node3[0] </pre>
	(cii)	<p>Head = 8 Free = 1</p> <pre> graph LR Head[8] --> Ali[Ali 5] Ali --> Ari[Ari 2] Ari --> Annie[Annie 4] Annie --> Lester[Lester 10] Lester --> Jenny[Jenny 9] Jenny --> Mimi[Mimi 0] Free[1] --> Node1[3] Node1 --> Node2[6] Node2 --> Node3[7] Node3 --> Cindy[Cindy 0] </pre>

	(d)	<p>Linked list is a <u>dynamic data structure</u>: it can grow and shrink at runtime by allocating and deallocating memory. So there is <u>no need to give initial size of linked list</u>.</p> <p>Ease of insertion/deletion: Inserting a new element in an array of elements is expensive; because room has to be created for the new elements and to create room existing elements have to shift. Deletion is also expensive with arrays until unless some special techniques are used. For example, to delete 1010 in id [], everything after 1010 has to be moved.</p> <p>No memory wastage: As size of linked list can increase or decrease at run time so there is no memory wastage. In case of array there is lot of memory wastage, like if we declare an array of size 10 and store only 6 elements in it then space of 4 elements are wasted. There is no such problem in linked list as memory is allocated only when required.</p> <p>Disadvantages: Pointer requires extra memory for storage. No direct random access</p>
